

Load securing system

Flexible modular system for all loads

- Modular, flexible system
- Select container twistlocks, stanchions or anchorrings according to your needs
- Patented sockets with simple welding
- ADR-approved container twistlocks
- Stanchions made of steel or aluminium

Secure the load exactly as you want

First you are driving building components to a warehouse and then collecting timber from the forest. Tomorrow you are going to be transporting planks to a builders' merchant or machine components from a factory. How on earth can you secure all these different loads?

With the LAXO Load securing system, you are getting a flexible, reliable solution for all kinds of transport. You can choose sockets, container twistlocks, stanchions or eyelets according to your needs. The fact that your needs are constantly changing doesn't matter at all – you can adapt and develop this system as much as you want.

When your company grows and develops, you can easily supplement the system with new components. The LAXO system already contains a large number of different load securing solutions, yet we are constantly working on innovative, new solutions in order to adapt the system to even more areas of use.

Five benefits of the load securing system

Different load every day

When you have equipped your platforms with LAXO sockets, you can change over the equipment before each journey. You are free to choose between container twistlocks, stanchions, anchorrings or other special solutions.

A smarter container lock

You can easily secure your container freight using our ADR-approved container twistlock. With a container twistlock in each corner, you can secure a container weighing up to 32 tonnes. And all installation is performed from above.

Lightweight and durable

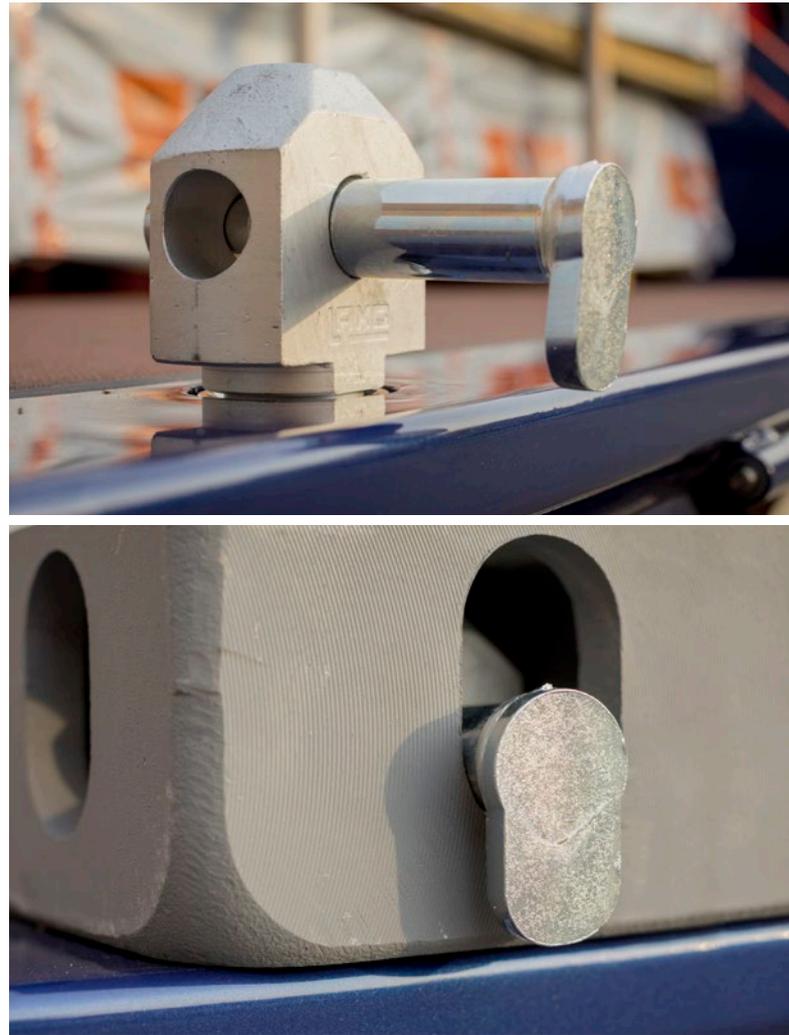

With stanchions made of seamless, anodised aluminium you can keep the weight down, at the same time as dealing with most of the challenges facing your platform – regardless of whether you are transporting roof trusses, machine components, planks or goods on pallets.

A stanchion that (almost) never breaks

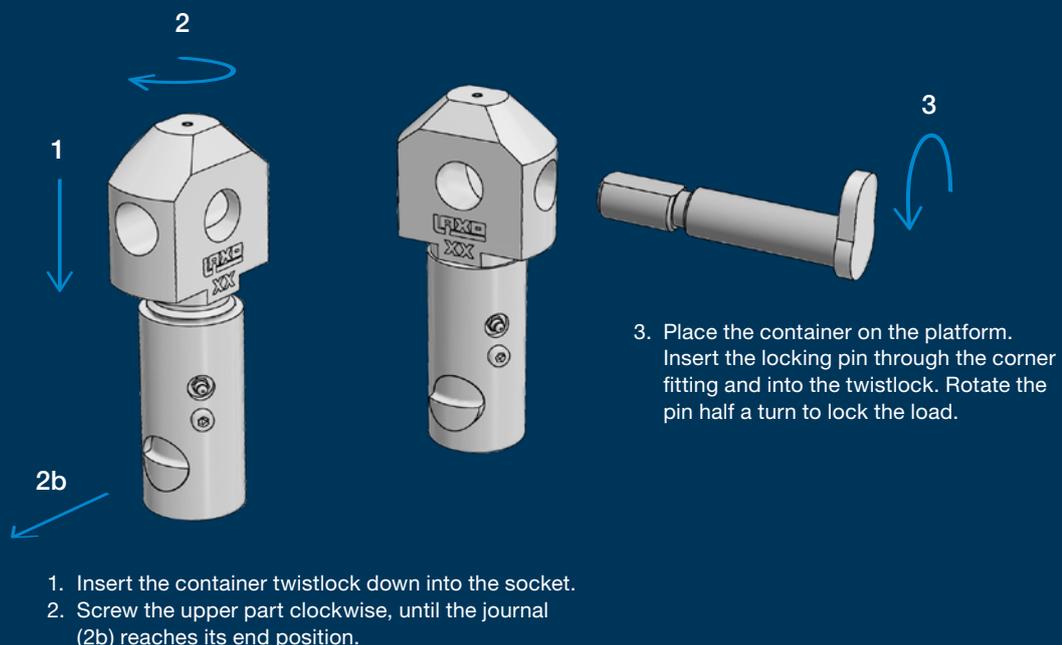

Our toughened steel stanchions can cope with extreme loads without deforming. The fact that the steel yields a little also reduces the stresses on both the vehicle and the attachments.

Original parts throughout

All accessories are made in the same factory, which means that the level of precision is perfect. With LAXO Original, all the parts interact with each other, and the Scandinavian quality ensures you can enjoy many trouble-free miles.

In the case of container freight, all securing of the load is performed from above.

LAXO goes its own way

We tend to say that we build good products for people who work with transport on the road or in the forest. By constantly pushing the boundaries of what is possible, listening to our customers' wishes and thinking outside the box, we have positioned ourselves as one of the world's foremost developers of bodies, timber equipment and load securing solutions.

Many of the inventions and solutions we have developed over the years have gone on to become the norm in the sector. When we look at many other makes today, we see innovations that we developed many years ago. We retain our leading position by incorporating flexibility, quality and profitability right from the design stage.

We build and develop

- Quick lock systems
- Skip loaders
- Timber bolsters
- Load securing systems
- Concrete mixers
- Demountable crane consoles
- Fixed platforms
